

So You Want to Create a Named Pipe in Genesis II

Mark Morgan

Creating Named Pipes in Genesis II

Creating Named Pipes (or simply Pipes) in Genesis II is a trivially easy process of using the standard create-resource tool on the service **PipePortType**. This creation call takes an optional JAXB parsed construction properties file (parsed by the class **edu.virginia.vcgr.genii.client.pipe.PipeConstructionParameters**) in which you can specify the pipe size. However, if you choose not to specify a pipe size, the default pipe size of 1M will be used.
